

Project Spotlight:

MidPoint as the Perfect Fit for the French Health Industry

In France, the law mandates healthcare facilities to implement an IAM solution by 2025. The law also requires hospitals to join Territorial Hospital Groups (in French, GHT), which implies a specific operating mode. With midPoint, KNS was able to easily develop a solution that meets their needs.

In France, hospitals are required by law to join Territorial Hospital Groups (in French, "Groupement Hospitaliers de Territoires", GHT), creating regional healthcare networks. The law mandates all healthcare facilities to implement an IAM (Identity and Access Management) and SSO (Single Sign-On) solution by 2025. These IAM solutions bridge the gap between HR software and a national directory containing identification numbers of healthcare practitioners to provision accounts in applications. This requires adapting midPoint to GHT operations. While there's a centralized IAM instance for the entire GHT, each facility retains autonomy in managing its personnel and applications. The GHT's IT department oversees access to GHT applications. Healthcare applications in France are highly specialized, lacking pre-packaged connectors; all connectors must be developed.

MidPoint's features make it easy to manage multi-sourcing, identity reconciliation, and native support for rights separation. KNS developed connectors for various HR software used in the French hospital market and a connector to gather data from national directories (RPPS and ADELI). Connectors for target hospital applications such as Electronic Health Records (DPI) and patient administrative management (GAM) are underway. MidPoint natively supports identity vigilance, ensuring that individuals working across GHT hospitals have a single identity with different personas. KNS contributed to enhancing the solution with necessary configurations for persona management. Additionally, KNS created a specialized healthcare demo version based on the public demo with data consistent with healthcare-specific information.

With midPoint, all crucial functionalities are already present, making implementation straightforward with minimal configuration required. If something is missing, development is quick; for instance, to match midPoint with a client's mailing list system, KNS collaborated closely with Evolveum to enhance the Azure AD connector.

KNS is a French IAM, SSO, and MFA integrator. With 20 years of experience, KNS intervenes at all levels of IT security. As a reference player and recognized expert, KNS provides its customers and partners with an impartial, clear, and pragmatic vision of digital security issues and related solutions.
